expressing erapeutic cells exand the Novel polynucleotides encoding a novel growth factor of a platelet-derived growth factor, useful for diagnostic applications, e.g. concerning cancer.

English 5; 111pp; Fig Claim 1;

The present sequence is the 5' truncated partial cDNA #2, encoding human platelet derived growth factor (PDGF)-D, formally known as Vascular Endothelial Growth Factor (VEGF)-G. It is derived from human foetal lung lambdagt10 cDNA library. It belongs to the VEGF/PDGF family. It functions as an activator of proliferation, differentiation, growth and motility of cells, that express PDGF-D receptor. This sequence is useful for inhibiting the growth of tumours, that express PDGF-D. Expression of PDGF-D and its proteolytic cleavage for generating an activated truncated form is useful for regulating receptor binding specificity of PDGF-D. PDGF-D antagonist is useful for inhibiting tissue remodelling during the invasion of tumour cells into normal cells. PDGF-D may be used to treat wounds, atherosclerosis, metastasis and migration of smooth muscle cells

It is derived from human foetal lung lambda gt10 cDNA library. It belongs to the VEGF/PDGF family. It functions as an activator of proliferation, differentiation, growth and motility of cells, that express PDGF-D receptor. This sequence is useful for inhibiting the growth of tumours, that express PDGF-D. Expression of PDGF-D and its proteolytic cleavage for generating an activated truncated form is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   xpressing

Use of platelet-derived growth factor, vascular endothelial growth factor, or their modulators for modulating neural stem cell or neural progenitor cell activity, particularly for treating e.g. Alzheimer's, ischemia or stroke.

22-23; 119pp; English. Claim 97; Page

The sequences given in ABQ80243-47 encode proteins which may be used in the method of the invention for alleviating or reducing a symptom of a disease or disorder of the nervous system. The method comprises administering platelet-derived growth factor (PDGF), vascular endothelial growth factor (VEGF), a combination of PDGF and VEGF, or a PDGF or VEGF agonist, to a patient in order to modulate neural stem cell or neural reducing the symptoms of a disease or disorder of the nervous system, e.g. neurodegenerative disorders, neural stem cell disorders, neural progenitor disorders, ischaemic disorders, neurological traumas, affective disorders, ischaemic disorders, neurological traumas, affective disorders, ischaemic disorders, neurological traumas, affective disorders, ischaemic disorders, huntington's disease, disorders, and disorders, Huntington's disease, harotrophic Lateral Sclerosis, spinal ischaemia, ischaemic stroke, spinal cord injury or cancer-related brain/ spinal cord injury, schizophrenia and other psychoses, depression, bipolar depression/disorder, anxiety syndromes/disorders, aggression, drug and alcohol abuse, obsessive compulsive behaviour syndromes, seasonal mood disorder, borderline personality disorder, cerebral palsy, life style drug, multi-infarct dementia, Lewy body dementia, age related/geriatric

dementia, epilepsy and injury related to epilepsy, spinal cord injury, brain injury, trauma related brain/spinal cord tissue injury, infection and inflammation related brain/spinal cord injury, environmental toxin related brain/spinal cord injury, environmental toxin related brain/spinal cord injury, multiple sclerosis, autism, attention deficit disorders, narcolepsy or sleep disorders. The PDGF and/or VEGF, is useful in the manufacture of a medicament for alleviating or treating these diseases or disorders, accelerating growth of neural stem cells or neural progenitor cells, or inducing proliferation or differentiation of these cells SSSSSSSSS

The invention provides novel human secreted proteins and polynucleotides encoding them. The secreted proteins can be expressed by standard recombinant methodology. The secreted proteins and polynucleotides are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They can also be used in diagnostic also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme in the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme inked immunosorbent assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, viruses and fungi and cardiovascular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. The present sequence represents a human secreted protein encoding cDNA

Claim 1; Page 373-375; 238pp; English

a human secreted protein. The sequences are useful for diagnosing or diagnosing a susceptibility to a pathological condition in a subject comprising determining the presence or absence of a mutation in the DNA or expression of the protein. The sequences are useful for identifying a binding partner to the protein comprising contacting the protein with a cityity. The DNA and protein sequences are used for preventing, treating or ameliorating a medical condition such as an autoimmune disease (e.g. multiple sclerosis, myasthenia gravis), blood coagulation disorders (e.g. afibrinogenaemia, haemophilia), blood platelet disorders (e.g. afibrinogenaemia, haemophilia), blood platelet disorders (e.g. surforome), neurodegenerative disorders (e.g. Alzheimer's disease, syndrome), neurodegenerative disorders (e.g. renal vein thrombosis, kidney infarction), cardiovascular disorders (e.g. renal vein thrombosis, kidney infarction), cardiovascular disorders (e.g. renal vein thrombosis, cegonorics), ascular disorders (e.g. aneurysm, ischaemia), respiratory disorders (e.g. tonsilitis, laryngitis), endocrine disorders (e.g. acromegaly, thyrotoxicosis), reproductive disorders (e.g. gastroenteritis, pyloric stenosis), infectious diseases (e.g. polio, rubella) and cancer. Sequences ABSS8469-ABSS8507 represent cDNA molecules encoding human secreted proteins of the invention The invention relates to an isolated nucleic acid molecule which encodes

                                                                                                                                                                                                                                                           9
The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogren's syndrome, vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating polyneuropathy, Guillain-Barre syndrome and chronic inflammatory demyelinating polynucleotide of the invention.

Claim 1; Page 417-418; 482pp; English.

The invention provides novel human secreted proteins and polynucleotides cencoding them. The secreted proteins can be expressed by standard recombinant methodology. The secreted proteins and polynucleotides are used to prevent, treat or ameliorate a medical condition in e.g. humans, also be used in diagnosting a pathological condition. The antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbent assays (BLISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiovascular disorders e.g. cardio arrest, cerebrovascular disorders e.g. cardio arrest, cerebrovascular disorders e.g. cardio arrest, cerebrovascular disorders e.g. cardio absorders e.g. corneal infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. The present sequence represents a human secreted protein encoding cDNA

Choi Soppet DR; Shi Y, Ch CE, DR,

for cancer, useful New secreted polypeptides and encoding polynucleotides, us preventing, treating and diagnosing diseases e.g. anemia, diabetes, asthma, psoriasis, Parkinson's and Alzheimer's.

Claim 1; Page 357-359; 238pp; English

The invention relates to an isolated nucleic acid molecule which encodes a human secreted protein. The sequences are useful for diagnosing or diagnosing a susceptibility to a pathological condition in a subject comprising determining the presence or absence of a mutation in the DNA or expression of the protein. The sequences are useful for identifying a binding partner to the protein comprising contacting the protein with a conjuding partner and determining whether the binding partner effects an activity. The DNA and protein sequences are used for preventing, treating or ameliorating a medical condition such as an autoimmune disease (e.g. multiple sclerosis, mysathenia gravis), blood coagulation disorders (e.g. afibrinogenaemia, haemophilia), blood platelet disorders (e.g. sarcoidosis, Sezary syndrome), neurodegenerative disorders (e.g. Alzheimer's disease, thrombocytopenia), vascular disorders (e.g. Alzheimer's disease, parkinson's disease), renal disorders (e.g. cardiac arrest, cornegaly, thyrotoxicosis), reproductive disorders (e.g. cardiac arrest, anorchia), gastrointestinal disorders (e.g. dastroenteritis, pyloric stenosis), infectious diseases (e.g. gastroenteritis, pyloric stenosis), infectious diseases (e.g. polio, rubella) and cancer. Sequences ABSS8507 represent cDNA molecules encoding human secreted proteins of the invention

Sequences of the invention are useful for the manufacture of a medicament for treating musculoskeletal disorder (MSD) which include promoting bone growth, cartilage differentiation and function, wound healing, neuron growth, preventing cartilage degradation or neuronal degeneration. They are useful for treating bone fractures, osteopenia, arthritis, sarcopenia, periodontal disease, tissue atrophy, traumatised connective tissues, grafted connective tissues and/or transplanted organs, bone or muscle loss due to malignancy, endocrine disorders and immobility. They are also used for prophylactically increasing or maintaining bone density in a mammal. The

                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to LPB5, an analogue of platelet-derived growth factor (PDGF) homologue. Sequences of the invention are useful for the manufacture of a medicament for treating musculoskeletal disorder (MSD) which include promoting bone growth, cartilage differentiation and function, wound healing, neuron growth, preventing cartilage degradation or neuronal degeneration. They are useful for treating bone fractures, osteoporosis, osteopenia, arthritis, sarcopenia, periodontal disease, tissue atrophy, traumatised connective tissues, grafted connective tissues and/or transplanted organs, bone or muscle loss due to malignancy, endocrine disorders and immobility. They are also used for prophylactically increasing or maintaining bone density in a mammal. The

                                                              acid
                                                                                                                                                                                                                                9
        The present invention relates to a vascular endothelial growth factor (VEGF) family member, VEGF-G. VEGF-G protein and nucleic acid molecules are used as modulating agents or as targets for developing modulating agents to regulate a variety of cellular processes e.g. cell proliferation, differentiation, migration and wound repair. VEGF-G modulators, i.e. VEGF-G protein, peptide, peptidomimetic or nucleic acid are used to treat a subject with aberrant VEGF-G protein or nucleic acid expression or activity e.g. deregulated cell growth, such as cancer, hyperptrophic bone disorders, disorders involving aberrant angiogenesis e.g. psoriasis, and chronic inflammatory diseases e.g. rheumatoid arthritis. VEGF-G gene expression is inhibited through the administratic of antisense molecules or ribozymes and by targeting the regulatory region of VEGF-G to prevent transcription of the gene in target cells

2276 1; 120 180 661 721 vaccine; screening; human; The invention relates to a novel method for detecting soft tissue sarcomwhich comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor. 9 Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue TTGTACCGAAGAGATGAGACCATCCAGGTGAAAGGAAACGGCTACGTGCAGAGTCCTAGA TTCCCGAACAGCTACCCCAGGAACCTGCTCCTGACATGGCGGCTTCACTCTCAGGAAT TGTACCGAAGAGATGAGACCATCCAGGTGAAAGGAAACGGCTACGTGCAGAGTCCTAGA Gaps DB 12; Length 4153; . ო 17 Other; Indels ü; Π T; 0 20; SEQ therapy; 854 G; 1174

Early detection of soft tissue sarcoma comprises determining export a gene in a first soft tissue sample and a normal soft tissue and comparing the gene expression, also useful in treating soft 2; SEQ ID NO 5810; 210pp; English. Zlotnik A; LABS (PROT-) PROTEIN DESIGN Ginsburg WM, WPI; 2004-441208/41 Example Aziz N,

ssion sample ssue pressic le sampl tissue The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

Sequence 4153 BP; 1253 A; 855 C; 854 G; 1174 T; 0 U; 17 Other;

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

lambdagt10 cDNA library. It belongs to the VEGF/PDGF family. It functions as an activator of proliferation, differentiation, growth and motility of cells, that express PDGF-D receptor. This sequence is useful for inhibiting the growth of tumours, that express PDGF-D. Expression of PDGF-D and its proteolytic cleavage for generating an activated truncated form is useful for regulating receptor binding specificity of PDGF-D. PDGF-D antagonist is useful for inhibiting tissue remodelling during the invasion of tumour cells into normal cells. PDGF-D may be used to treat wounds, atherosclerosis, metastasis and migration of smooth muscle cells

```
The invention relates to novel NOVX protein and their encoding DNA's, mature forms of the proteins or sequences that are at least 95% identical to, or having one or more conservative amino acid substitutions in, the proteins. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, peferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders and polypeptides may asthma, and various dyslipidemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, hematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridization probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. This sequence corresponds to one of the NOVX proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g.

AAU12172-AAU12446 represent novel human secretory and transmembrane. PRO
polypeptides. The PRO polypeptides are useful to detect other PRO
polypeptides, to link bioactive molecules to cells expressing PRO
polypeptides, and to detect the presence of mammalian lung, colon,
breast, prostate, rectal, cervical or liver tumours by comparing PRO
polypeptide expression in a cell sample to that in a control sample. Some
of the 275 sequences are also useful to stimulate the release of tumour
necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or
differentiation of chondrocytes, the proliferation or gene expression in
pericyte cells, the release of proteoglycans from cartilage, the
proliferation of inner ear utricular supporting cells or of T-
lymphocytes, the release of a cytokine from peripheral blood monocytes
(PBMCs), or the proliferation of endothelial cells. Some of the PRO
polypeptides may modulate glucose or free fatty acid uptake by skeletal
muscle cells or by adipocytes; or inhibit binding of A-peptide to factor
VIIA. The PRO polypeptides can be used in assays to identify molecules
involved in binding interactions. The polynucleotides encoding PRO
polypeptides can be used to generate probes, antisense RNA/DNA,
transgenic or knock out animals and can be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Some

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to LP85, an analogue of platelet-derived growth factor (PDGF) homologue. Sequences of the invention are useful for the manufacture of a medicament for treating musculoskeletal disorder (MSD) which include promoting bone growth, cartilage differentiation and function, wound healing, neuron growth, preventing cartilage degradation or neuronal degeneration. They are useful for treating bone fractures, osteoporosis, osteopenia, arthritis, sarcopenia, periodontal disease, tissue atrophy, traumatised connective tissues, grafted connective tissues and/or transplanted organs, bone or muscle loss due to malignancy, endocrine disorders and immobility. They are also used for prophylactically increasing or maintaining bone density in a mammal. The present sequence is human LP85 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9

                                                                                                                                                                                                                                      60
                                                                                                                                                                                                                                                                                                            ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to
ABB85003. The PRO proteins and polynucleotides have cardiant, cytostatic,
antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic
activities, and can be used in gene therapy. The PRO polynucleotides,
proteins, agonists and antagonists are useful for treating or diagnosing
a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g.
cardiac hypertrophy, trauma, cancer, age-related macular degeneration,
atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis,
angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour
angiogenesis (such as breast carcinoma and liver carcinoma) and wound
healing. The PRO polynucleotides have applications in molecular biology,
including use as hybridisation probes, and in chromosome and gene
mapping. ABL88259 to ABL88267 represent primers and probes used in the
exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    300

3 Gao ŝ Filvaroff E, L, Sherwood S od WI, Zhang / AL, She Wood WI,

ency New secreted and transmembrane PRO nucleic acids, for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, axquired immunodefisyndrome (AIDS), or cancer. The invention describes an isolated nucleic acid (1) comprising, or which has 80 % sequence identity to, or the full-length coding sequence of, one of 275 nucleotide sequences, and which encodes a corresponding cof 275 nucleotide selected from 275 amino acid sequences, where all sequences are given in the specification. The polypeptide encoded by (1) is used to detect PRO polypeptides, link a bioactive molecule to a cell expressing a cetect PRO polypeptide, modulate a bioloactive molecule to a cell expressing a cetect PRO polypeptide, modulate a bioloactive molecule to a cell expressing at the uptake of glucose or free fatty acid by cells, stimulate the telease of tumour necrosis factor (TNF)-alpha from human blood, modulate the proliferation or differentiation of cells or gene expression, stimulate the release of proteoglycans, stimulate the release of cytokine comperipheral blood mononuclear cells, inhibit the binding of A-peptide to factor VIIA, or detect the presence of tumour in a mammal. The nucleic acid and polypeptide encoded by it, are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome birth defects, premature aging, acquired immunodeficiency syndrome and sent sense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. This is the amino acid sequence of a novel human secreted and

The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the treatment of diabetes, bone and/or cartilage disorders (e.g. rheumatoid arthritis, sports injuries, osteoarthritis), obesity, hyper- or hypo-insulinaemia, hearing loss, and coagulation disorders (e.g. stroke, heart attack). Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABU80870-ABU81144 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequence useful.
                                                                                                                                                                                                                                                                                                                                                          diabetes, rheumatoid in mammals, stroke,

polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking bioactive molecules to cells expressing PRO polypeptides, for modulating biological activities of cells expressing PRO polypeptides, and for for identifying agonists or antagonists. The PRO polypeptides are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present invention relates to the isolation of novel human PRO ypeptides, and the polynucleotide sequences encoding them. The PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       l and transmembrane PRO nucleic chromosome and gene mapping, as in chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Deforge L, I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       162
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240
for stimulating the release of tumour necrosis factor (TNF)-alpha from human blood, for stimulating the proliferation or differentiation of chondrocytes, and detecting the presence of tumours. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals or knockout animals, for the genetic analysis of individuals wit genetic disorders, and in gene therapy. ABU66570-ABU66844 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web sit at sequata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LLKYFN

bone Two hundred and seventy five nucleic acids encoding PRO polypeptides useful for treating pericyte-associated tumors, diabetes and various and/or cartilage disorders, e.g. arthritis.

Claim 12; Fig 186; 659pp; English.

The invention describes an isolated human PRO polypeptide. The PRO polypeptides are useful in detecting PRO polypeptides in a sample, in linking a bioactive molecule to a cell expressing a PRO polypeptide, and in modulating at least one biological activity of a cell expressing a PRO polypeptide. PROJ132 stimulates hypertrophy of a cell expressing a PRO polypeptide. PROJ132 stimulates hypertrophy of neonatal heart and is thus useful for treating cardiac insufficiency disorders. PROJ136, and PROJ36, PROJ26, PROJ36,

The invention relates to an isolated nucleic acid comprising at least 80% sequence identity to a PRO (secreted and transmembrane protein) cDNA comprising a nucleic acid (a) encoding a PRO bolypeptide, or its extracellular domain (with or without its associated signal peptide), which comprises any of the 275 120-850 residue amino acid sequences, given in the specification; (b) comprising any of the 275 300-3500 incleotide sequences, given in the specification, or of the DNA deposited under any of the American Type Culture Collection (ATCC) Accession Numbers listed in the specification or of the DNA deposited under any of the American Type Culture Collection (ATCC) Accession Numbers listed in the specification or of the DNA deposited under any of the American Type Culture Collection (ATCC) Accession Numbers listed in the specification or of the DNA deposited under any of the American Type Culture Collection (ATCC) Accession Numbers listed in the specification of PND preptide a vector, producing a PRO polypeptide, the isolated PRO polypeptide of fused to a heterologous amino acid sequence, an anti-PRO polypeptide of fused to a heterologous amino acid sequence, an anti-PRO polypeptide of fused to a heterologous amino acid sequence, an anti-PRO polypeptide, alinking a bloactive molecule to a cell expressing a PRO polypeptide, stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human bload, (or protegolycans from adulating the uptake of glucose or FRA by skeletal muscle cells (production from peripheral bload monouclear cells (production or farlymphocyte cells, or gene expression in pericyte cells (or for T-lymphocyte cells, or fendochelial cells, inhibiting the presence of a tumour in a mammal and an olipocyte cells (or for T-lymphocyte cells, or of endochelial cells), inhibiting the presence of a tumour in a mammal and an olipomulating the presence of a tumour in a mammal and an olipomulating the presence of a tumour in a mammal and gene mapping, in plunding uses as hybridisation probes, in chr

Claim 12; Fig 186; 659pp; English

The invention relates to an isolated nucleic acid comprising, or which is at least 80% identical to, or the full-length coding sequence of, any of the 275 nucleotide sequences, encoding the corresponding PRO polypeptide (one of 275 nucleotide sequences, encoding the corresponding PRO polypeptide comprises the full-length coding sequence of the DNA deposited under American Type Culture Collection (ATCC) accession number in a list given in the specification. Also included are vectors and host cells for producing PRO proteins, PRO fusion proteins, anti-PRO antibodies, PRO proteins, methods for stimulating the release of TNF-alpha (tumour necrosis factor alpha) from human blood, (and the proliferation of of chondrocyte cells, the proliferation of chondrocyte cells, the release of acytokine from proteins in pricyte cells, the release of acytokine from peripheral blood mononuclear cells, the release of acytokine from peripheral blood mononuclear cells (PBMC), or the proliferation of adjocyte cells, a method for inhibiting the binding of A-peptide to factor VIIA, or the differentiation of adjocyte cells, a method for inhibiting the binding of A-peptide to factor VIIA, or the differentiation of adjocyte cells, a method for detecting the presence of a tumour in a mammal and oligination of proliferation of adjocyte cells, a method for detecting the presence of a tumour in a mammal cells, a method for detecting the presence of a tumour in a mammal oligination of proliferation of adjocyte cells, a method for detecting the presence of a tumour in a mammal cells, a method for detecting the presence of a tumour in a mammal and oligination probe derived from any of the nucleic acide and polypeptides are useful for treating infury, immunodeficiency syndrome), cancer, or diabetic complications. The nucleic acide are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typhing. The present sequence represents a PRO protein of the invention

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the uptake of strelease of TWN-alpha from human blood, for modulating the uptake of glucose or FPA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of inner ear utricular supporting cells, cor stimulating the proliferation of inner ear utricular supporting cells, cor stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, cor stimulating proliferation of endothelial cells, for stimulating the proliferation of endothelial cells, for stimulating proliferation of endothelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonuclectide probes are useful for isolating genomic and cDNA nuclectide sequences or antisense probes. (I) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding interaction. A polynuclectide (II) encoding (I) is useful in the development and soremaining of therapeutically useful reagents RN and BNA, in the preparation of PRO polypeptide, for generating transgenic animals which in turn are useful in the development and soremaining of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating probes. An anti-(I)-antibody is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, tissue typing. This is the amino coll and (II) are useful for tissue typing. This is the amino coll and transmentance of a novel human secreted and transmentance of a novel human secreted and transm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

and New isolated nucleic acid encoding a secreted and transmembrane polypeptide, designated e.g. PRO1114 or PRO4978, useful in chromosome gene mapping, in generating antisense RNA and DNA, and in gene therapy WPI; 2003-687639/65 N-PSDB; ADA76135.

Claim 12; Fig 186; 659pp; English

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are

               creagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of of human microvascular endothelial cells, for modulating the uptake of stimulating differentiation of adipocyte cells, for stimulating proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides which stimulate the mammablian haemoglobin-associated disorders such as various thalasseamias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polypeptide of the invention. eating nucleic acid, useful for preparing a composition for tumors. New PRO e.g.,

Claim 12; Fig 186; 660pp; English

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for chordstate, rectal, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for modulating the proliferation of or gene expression in pericyte cells, for stimulating the release of groceoglycans from cartilage, for stimulating the release of cyckines from PBMC cells, for inhibiting the binding of A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte cells and for stimulating the invention. Note the sequence represents a human PRO polypeptide of the invention. Note The sequence represents a human PRO polypeptide of the invention. Note: The sequence represents a human processed also available in electronic format from USPTO at
